

Puppy Inventory System

Streamline the puppy inventory management system and ensure puppies find loving homes with ease

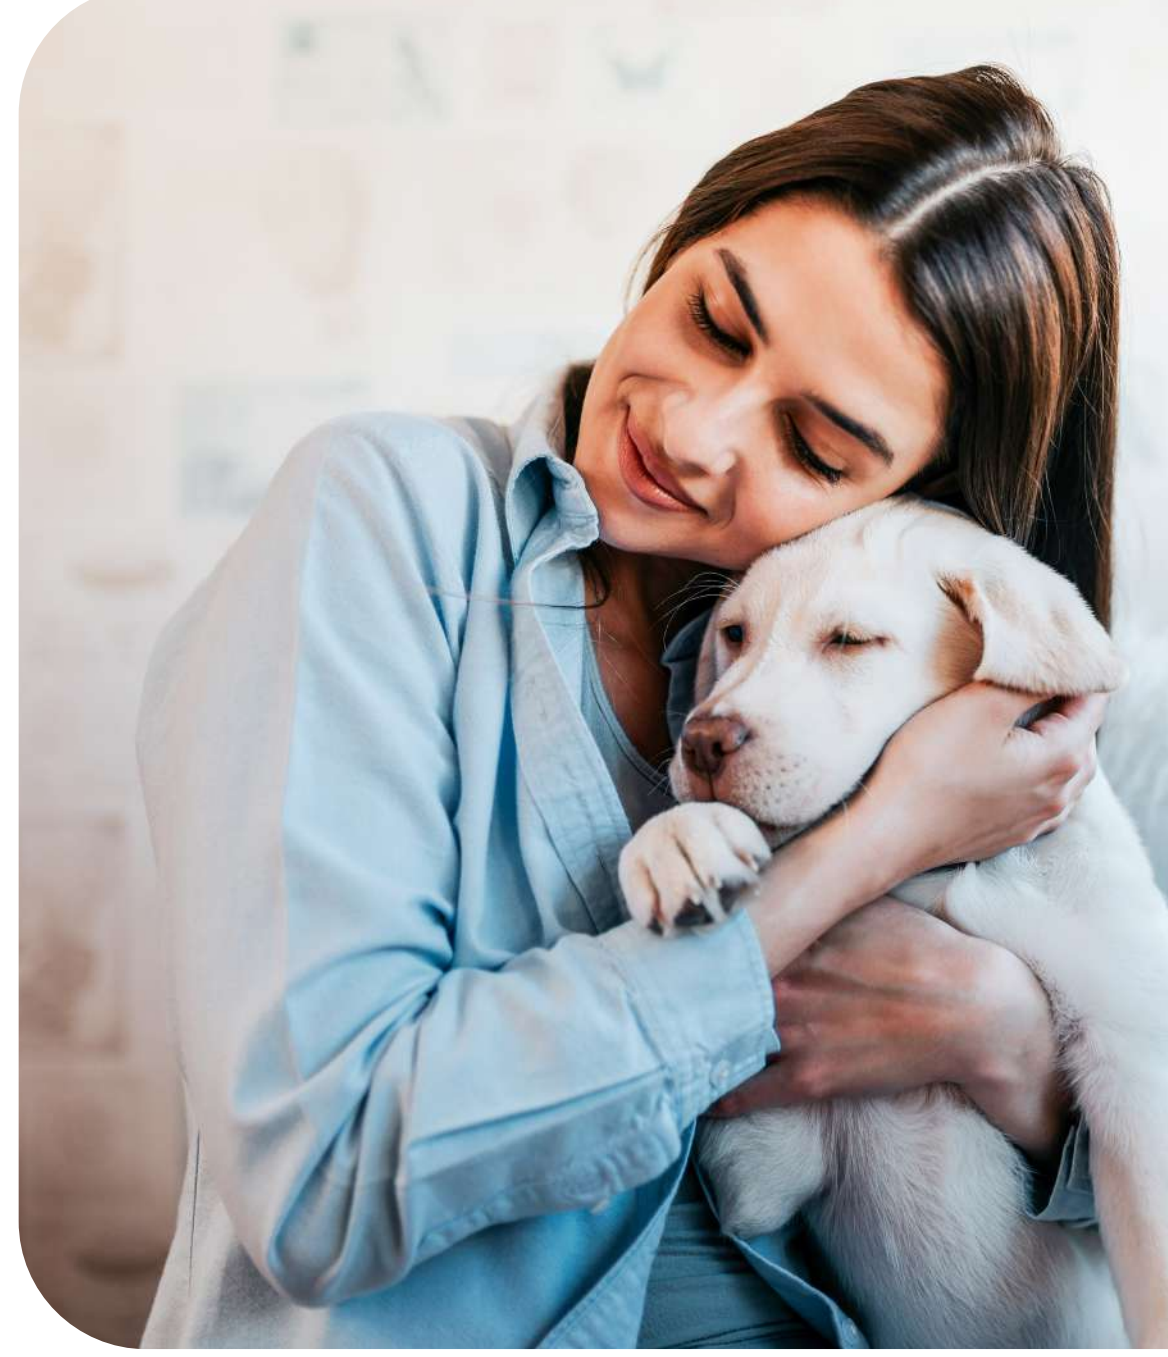

About us:

This project is built for our client, who is deeply engaged in the realm of puppy sales and pet counseling. With a passion for connecting ethically raised puppies with loving homes, they sought assistance in streamlining their operations. We developed a custom web application tailored to their specific needs. This application efficiently manages their business inventory, allowing easy tracking of essential details such as puppy status, and location via tracking IDs, and pricing. By consolidating all relevant information into a single platform, we've empowered the client to stay effortlessly updated and focused on their goal of connecting puppies with their forever families.

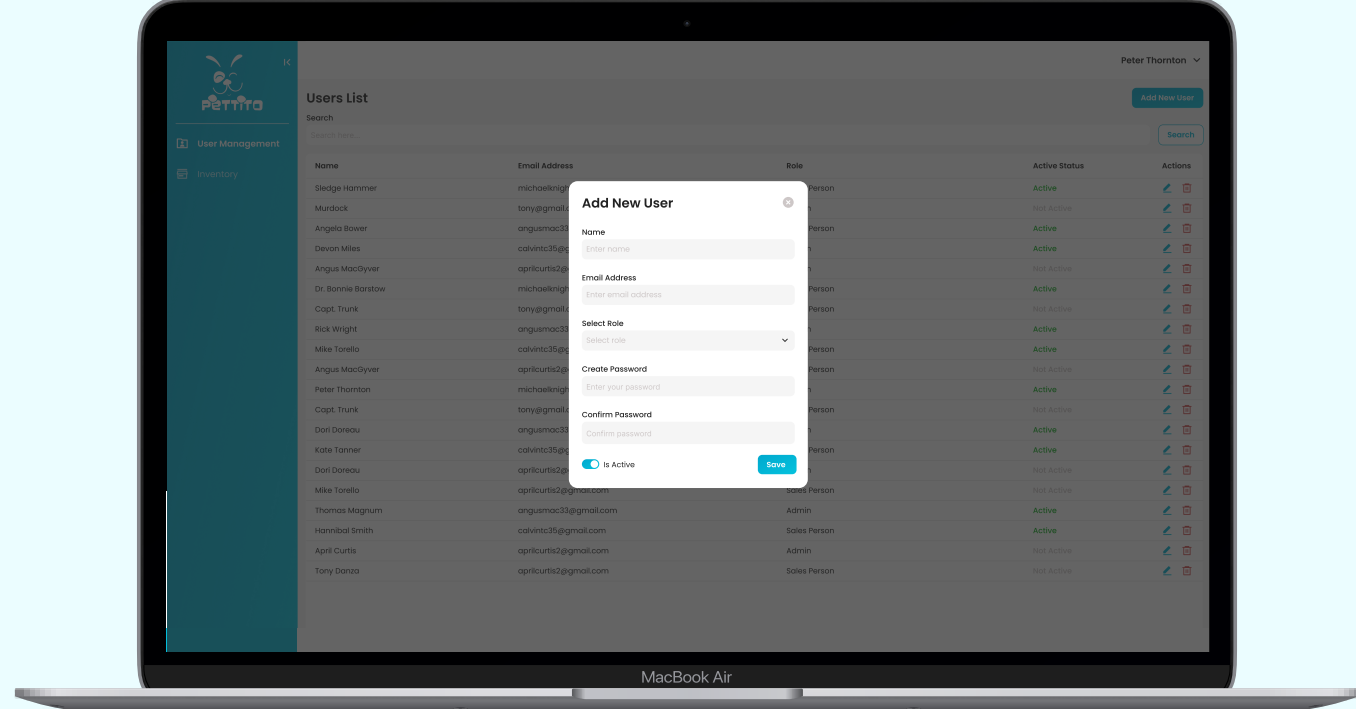

Project requirement:

Our client faced significant challenges managing their business inventory using Excel sheets. Updating and tracking inventory status in real-time was cumbersome and prone to errors. He faced inefficiencies and delays in accessing the required data due to the need to manage multiple sheets separately. Sometimes, changes made by team members were difficult to trace and often overlooked, leading to confusion about whether a dog was sold or still available. This resulted in inefficiencies and a lack of clarity regarding current stock, location, and pricing. To streamline operations and ensure accurate tracking, our client was looking for a solution that would simplify inventory management with a user-friendly interface.

Challenges with the solution:

The challenge we faced was consolidating scattered data from various locations into one accessible platform while keeping costs low and implementation time short. Our solution, the Puppy Inventory Management System, streamlined this process, allowing our client to effortlessly manage inventory and track status with just a few clicks. Our project aims to provide a user-friendly system that handles these issues fully, ensuring accurate inventory management with ease. We are now about to begin another phase and are ready to add new features to it.

Features:

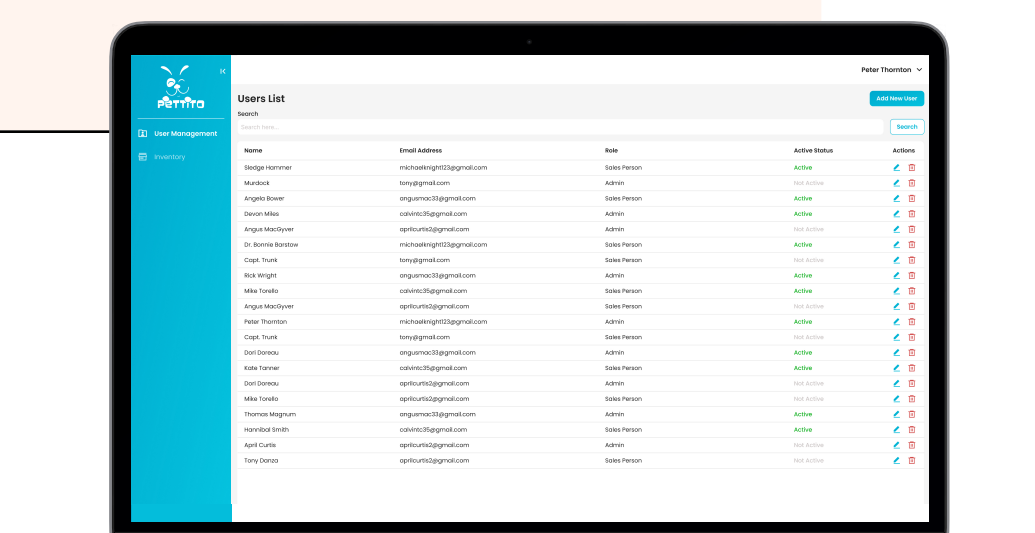

User management:

The system encompasses two predefined roles, i.e.,

Admin

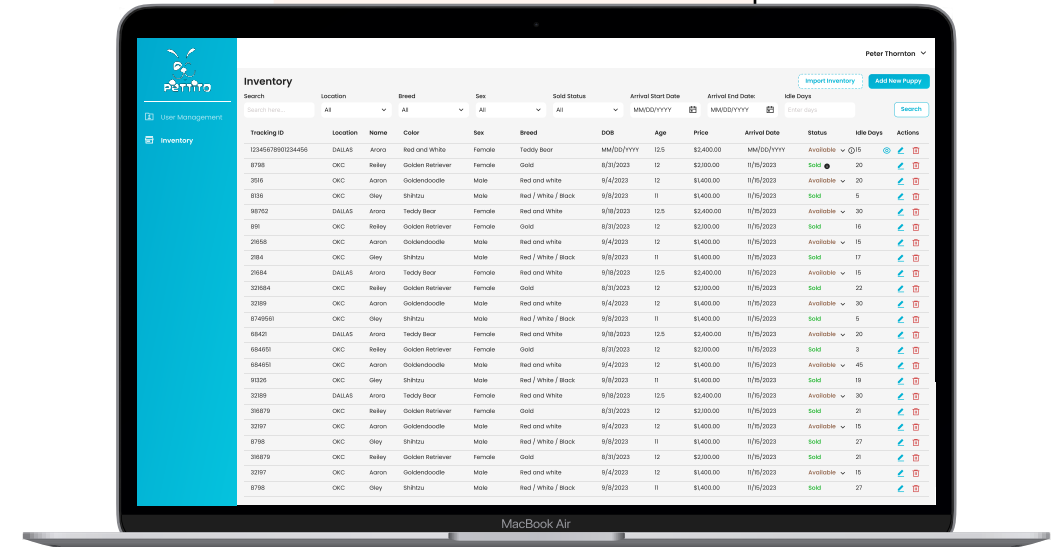

Sales Person

Admins possess full access, including the ability to add, view, and modify all data across modules. They manage users via user management, with the capability to view listings of all added users. Salespersons, on the other hand, are limited to viewing the "Puppy" module, where they can mark puppies as sold and input sales amount and date. This hierarchical structure ensures efficient management and secure access for all users.

Inventory:

The Inventory System includes comprehensive details of puppies, such as tracking IDs, location, name, color, breed, price, arrival date, and current status (sold or available). Admins can add new puppies, while sales personnel can update the status and price of sold puppies. Additionally, the system allows for the easy import of data samples. Also, we can check the detailed history of all the puppies like their past locations etc

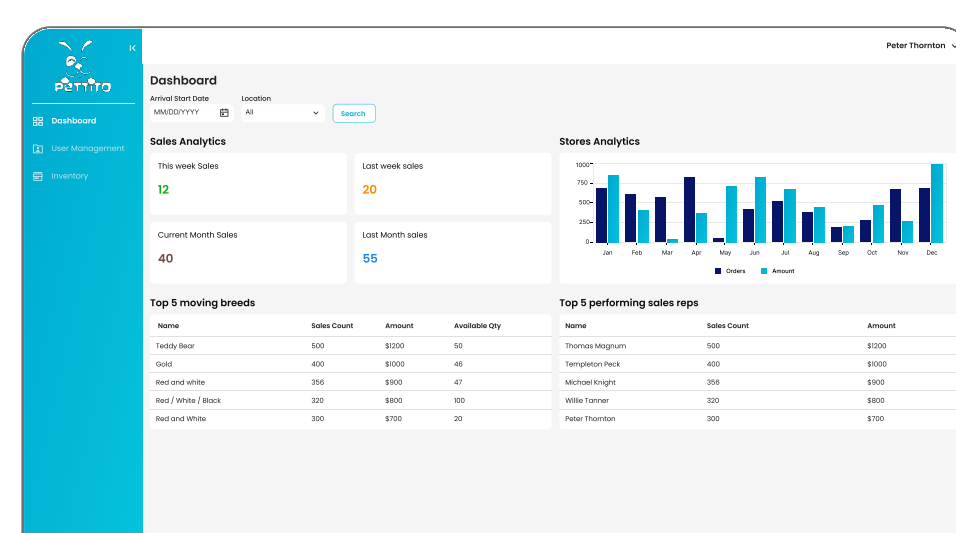

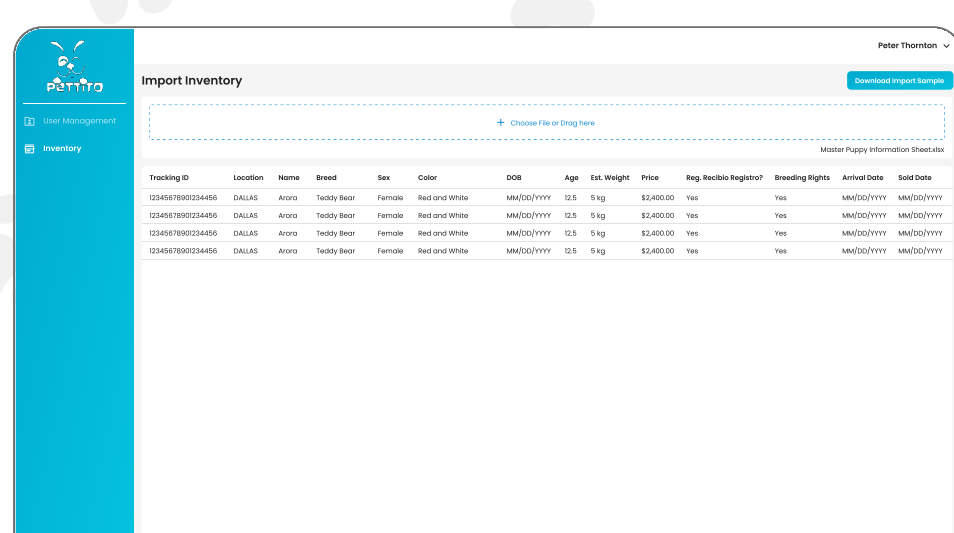

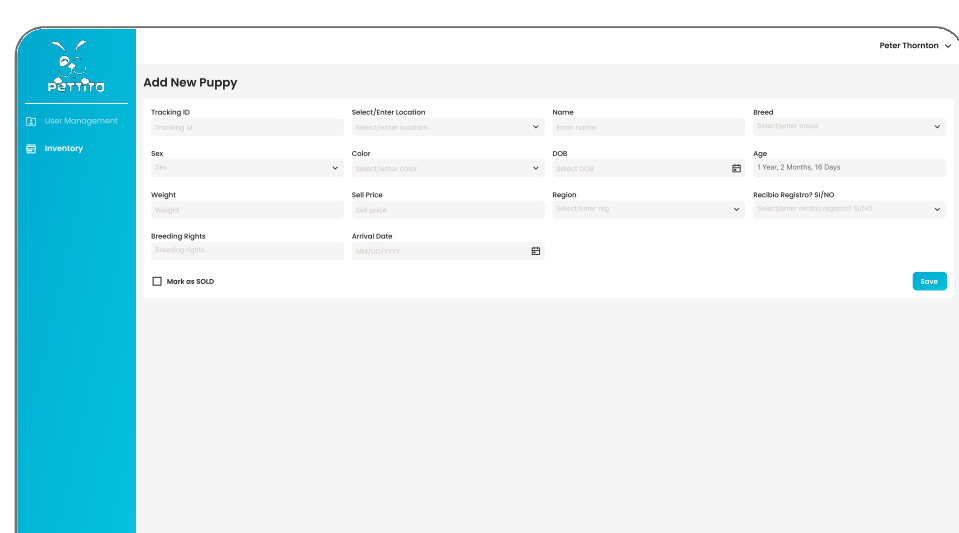

Integration:

The website, Square POS, and inventory system are seamlessly integrated, ensuring that any updates or modifications made in one platform reflect across all three. Upon any data alterations in the POS or inventory system, the admin receives a notification for approval. Once confirmed, the changes propagate throughout the interconnected systems, ensuring consistency and accuracy across the board.

Results

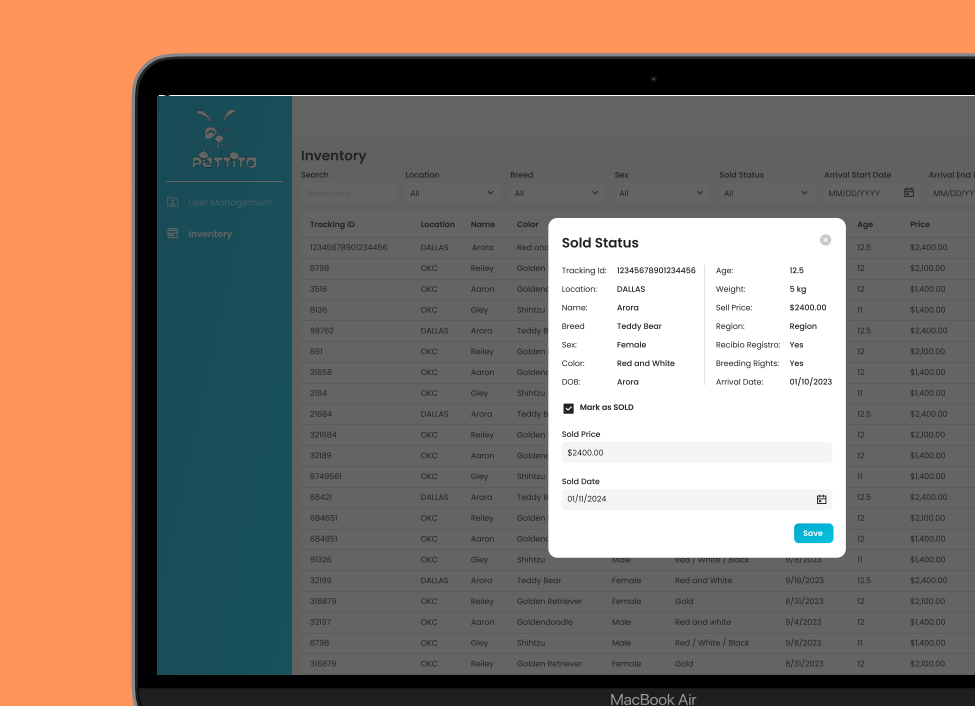

We made every effort to meet the client's needs, and in the end, we did it! Our solution helped him to easily oversee his inventory and keep an eye on his business. It made everything faster and more organized. This simplified approach has not only helped him to manage and track his inventory but also has significantly improved customer management for our client. Now, they can manage their business from anywhere using an app. In the end, we made the app the client had in mind, and they were happy with it.

Feedback

"Working with Paresh and his team was enjoyable. Right from our first meeting, I knew I made the right choice. They understood my needs perfectly. I'm extremely happy with the Puppy Inventory Management System they provided. It's made tracking inventory easy and mistake-free. The system's easy-to-use design and great features went beyond what I expected. I'm looking forward to working with them again in the future."

The Best Desktop Application Built by ExcelHunters

Whether you want to build a similar app like Puppy Inventory System or want a consultation for software migration, ExcelHunters can help you streamline your ideas and bring them to life.
