

About the project

PrimeERP Solution is an advanced fleet and asset management platform designed to help businesses monitor and manage their vehicles, equipment, and workforce in real time. This solution offers features like GPS tracking, diagnostics, maintenance scheduling, and compliance monitoring, allowing companies to optimize their operations, improve safety, and reduce downtime. The platform integrates seamlessly with various systems, providing businesses with a comprehensive view of their assets and enabling smarter decision-making.

About the client

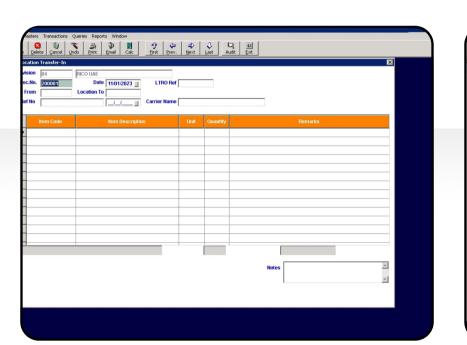

Our client, based in Dubai, specializes in warranty management and mission-critical spare parts service solutions for manufacturers in Hi-Tech, Cybersecurity, MedTech, and Industrial Security sectors across the MEA and APAC regions. With a partner network spanning over 40 countries and more than two decades of experience, they help manufacturers extend their reach and streamline product lifecycle management, reverse logistics, and repair services.

Tech stack

Project Requirement

Our client, a Fortune 500 company with a global presence, is facing significant challenges in managing their data. They were using 10-15 different applications for each and every module, which made it difficult to keep track of everything and caused inefficiencies. The reliance on outdated technology like VB6 slowed down their system and also led to issues with data security and performance. Since they work with top-tier companies, data loss or security breaches could have serious consequences. This led to frustration, as managing so many separate systems was overwhelming. They needed to consolidate everything into one platform and upgrade to modern technology to streamline their operations and ensure data security.

Solution

We started by having 2-3 detailed meetings with the client to fully understand the scope of their needs, as the project was large and complex. After spending around 15 days carefully planning a complete solution, we began development. The challenge was building the new application while ensuring the maintenance of their old data and their old systems, which included 10-15 separate applications, continued to function. Migrating all the data from these different applications was a difficult task, with our primary focus being on ensuring security and data integrity. To enhance security, we implemented B2C Azure Active Directory for authentication. Over the course of three years, we successfully merged all the applications into a single, unified web platform and migrated it from the legacy VB6 to the latest DotNet application We continue to implement changes and improvements as required, ensuring the system stays up-to-date and secure.

Modules

Division:

The division section in the system manages and categorizes various business units based on their division codes, descriptions, master divisions, and related vendor details. It provides a clear structure for managing different segments, with each division linked to its respective master division, vendor code, and FSL (Field Service Location) name. This organization ensures that each business area is tracked efficiently for streamlined operations.

Stock Location :

The stock location section organizes inventory by assigning specific codes and location prefixes for easy tracking. Each stock item is linked to its division code, currency, and vendor details, ensuring accurate and efficient management of product locations. This system helps streamline the tracking and movement of goods across various stock points, managing inventory by warehouse location, and improving overall inventory visibility.

User:

Each user is identified by a unique User ID, name, and email, with assigned roles such as "Service Manager" or "Administrator" that define their system permissions. Users are categorized by location and division codes to ensure they manage tasks relevant to their area while maintaining operational control. The system uses a B2C login, with user accounts managed through the Azure Portal. If an account is deleted via the portal, it is deactivated, preventing further access. Additionally, user data is continuously synced through the B2C login system.

Inventory

Inventory:

The inventory module provides detailed information such as vendor, brand, product category, HS code, country, delivery mode, customer region, order type, and salesman details. It also tracks stock adjustments, warehouse data, and low stock levels with alerts to restock as needed. Additionally, it manages product location transfers, bin transfers, and stock audits, ensuring smooth inventory flow. Users can easily export all these details in multiple formats for reporting and analysis.

The purchase process covers all key stages, from order placement to returns, ensuring a smooth flow of information. It includes order confirmation, purchase order creation, cancellations, Goods Receipt Note (GRN) inbound, GRN approval, and purchase returns. Each step is documented and managed efficiently, tracking all relevant data from start to finish. The purchase process, integrated with Nanonets, automates invoice data extraction, enabling fast uploads and eliminating manual entry, especially for purchase returns, ensuring seamless end-to-end tracking.

Sales :

The sales process involves generating a sales order, followed by order acknowledgment and sales invoice creation. It includes updating the sales order date, managing sales returns, and handling defective order updates. Additionally, flash order notes are added to provide key information, ensuring all sales-related data is tracked and documented from the initial order to the final resolution. The sales process, integrated with Nenonet, automates invoice data extraction, enabling quick uploads and fetching all details in seconds.

Delivery:

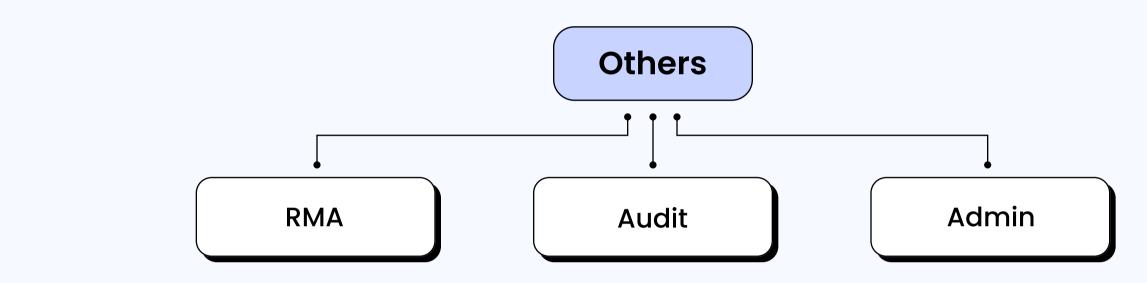

The delivery process begins with the creation of a delivery order, followed by the generation of an Air Waybill (AWB) for shipment tracking. Once the goods are delivered, the proof of delivery is uploaded to confirm that the order has been successfully completed and received by the customer.

Billing

Inventory:

The system provides detailed records of invoices, item specifics, and price ranges and supports multi-currency transactions. It tracks billing history from multiple vendors, ensuring accurate financial management. Additionally, it offers client-wise reporting and comprehensive insights into P&L accounts, customer pending details, sales accounts, and all transaction data, providing easy access to previous purchase and sales information.

The RMA system manages product returns and repairs by tracking customer requests for faulty product exchanges or returns. It provides detailed logs, including request numbers, order references, vendor information, and status updates. Users can efficiently create, modify, and resolve RMA requests, streamlining the process of handling product returns and technical issues.

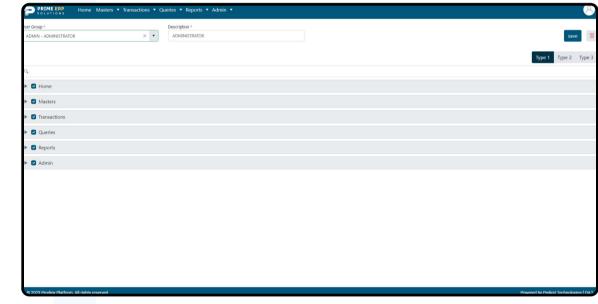

Audit:

Audit logs track user actions and system changes for accountability and compliance, providing a chronological record of activities. System logs record events, errors, performance, and service statuses, maintaining a full history of changes for insights into operations and user activity.

Admin	•

The admin has full authority to create, edit, or delete user data and modify their access rights as needed. They can create users, assign roles, and grant access to specific areas like divisions and locations. Additionally, the admin can update or edit user permissions at any time, ensuring flexibility and control over user roles and access within the system.

Reports

Reports:

The Reports section offers comprehensive insights into transactions like order deliveries and outbound shipments, enabling users to track delivery dates, item details, quantities, and destinations for accurate record-keeping and informed decision-making in supply chain management. It also facilitates the extraction of monthly and yearly billing reports in CSV and PDF formats, ensuring effective monitoring of stock, inventory, and records.

Review

We are extremely pleased with the work ExcelHunters has done to modernize and integrate our legacy systems. He paid great attention to detail and made sure our data was secure during the migration. The new platform has made our operations much smoother, and we are still working with him to add new features to make the system even better and easier to use.

Need any more juicy details or have questions? Just hit the below link to schedule a call.
